The Federal Information Processors Standards (FIPS) are designed to provide a framework for the protection of sensitive information in electronic systems and networks. FIPS 199 outlines the policies, procedures, and guidelines for the protection of information that is critical to the operations and management of the government. The standards cover a wide range of areas, including security architecture, risk management, access control, and auditing. FIPS 199 is intended to be flexible enough to accommodate the diverse needs of different agencies, while also providing a common set of standards that can be used to evaluate the security of information systems. The standards are designed to be used in conjunction with other security standards, including those established by the National Institute of Standards and Technology (NIST).
